

ClearPaisa Project Brief & Roadmap

Project Vision

ClearPaisa is an AI-powered personal finance platform. The long-term objective is to provide users with a unified financial timeline by combining multiple trusted data sources, beginning with Gmail and Account Aggregator (Setu). The platform should evolve into a financial intelligence assistant capable of explaining spending, predicting cash flow, identifying subscriptions, and answering natural-language financial questions.

Current Objective

At this stage, the priority is NOT building the complete application UI. The immediate goal is to successfully integrate Setu Account Aggregator in the sandbox environment, understand the consent flow, obtain API credentials, fetch transaction data, and expose that data through a clean backend API that can later be consumed by any application.

Work Completed

- Created a registered FIU (Financial Information User) in Setu.
- Created an Account Aggregator product instance in TEST mode.
- Began sandbox onboarding.
- Verified company PAN during onboarding.
- Configured branding and consent flow.
- Selected the appropriate FIU purpose (Customer spending and budget analysis).
- Began configuring consent defaults, redirect URI, and data usage.

Important Findings

- Setu Account Aggregator provides consent-based financial data.
- It is not a universal real-time UPI event stream.
- Gmail remains useful for receipts, invoices, and merchant context.
- The system should therefore be modular and support multiple providers through a common interface (IDataProvider).

Target Architecture

Data Sources:

1. Setu Account Aggregator
2. Gmail
3. CSV Statements
4. PDF Statements

Future: SMS, Finvu, OneMoney, additional AA providers.

Flow:

User -> Consent -> Provider -> Backend -> Transaction Normalizer -> Unified Database -> Analytics/API -> Any Client Application

Backend Goals

Expose APIs such as:

- Create Consent
- Consent Status
- Fetch Accounts
- Fetch Transactions
- Refresh Sync

- Webhook Receiver

The backend should be reusable regardless of frontend.

Long-Term Product Goals

- Unified transaction timeline
- AI categorization
- Merchant normalization
- Subscription detection
- Budgeting
- Cash-flow insights
- Financial health score
- AI financial assistant
- Predictive analytics

Current Next Steps

1. Finish Setu sandbox configuration.
2. Obtain sandbox API credentials.
3. Implement backend integration.
4. Test consent flow.
5. Fetch sample transactions.
6. Build reusable API layer.
7. Integrate with existing application.

Instructions for Antigravity

Treat this as the master project direction. Preserve modular architecture, keep all financial providers behind a common interface, prioritize backend correctness over UI polish, and build incrementally. Focus first on the Setu sandbox integration, then Gmail integration, followed by transaction normalization and analytics.
